

TIFF view made easy – even convert to PPT or PDF from any size, type or compression

TIFF (Tagged Image File Format) is an open, well documented standard created by many vendors like **Catia, UG** and other application providers. It is a popular format because of its flexibility and many tags + free viewers. This may be the reason for selecting **TIFF as a well-suited archival format** over the long haul.

These very advantages - however – also have drawbacks. **PowerPoint**, for instance, will not insert tiled TIFFs, TIFFs of a certain size, or TIFFs saved with some compression schemes.

TIFFs in their uncompressed form easily get so large that the office products like Word, PowerPoint and the free viewers cannot read them. To create smaller files TIFF as a format has options for using almost all the various compression types ever invented. They may also be tiled for easier handling.

So in short – they may be too big or too varied.
